

Первым делом я установил OS Panel 6.0, новая версия отличается от той, которая указана в pdf'e, так что мне пришлось самому устанавливать phpmyadmin.

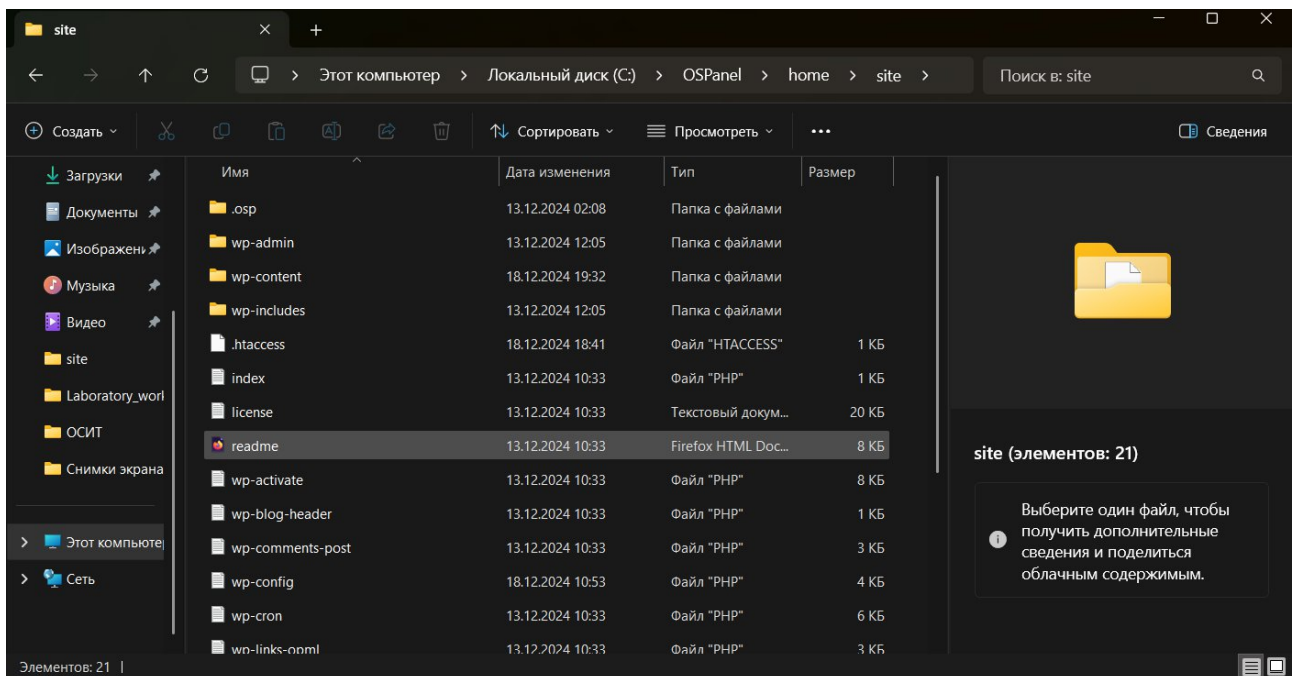

Я создал две папки: .ost и public. В public я распаковал скачанный с официального сайта архив, а в .ost добавил файл конфигурации project.ini. Он содержит версию PHP и ссылку на папку public.

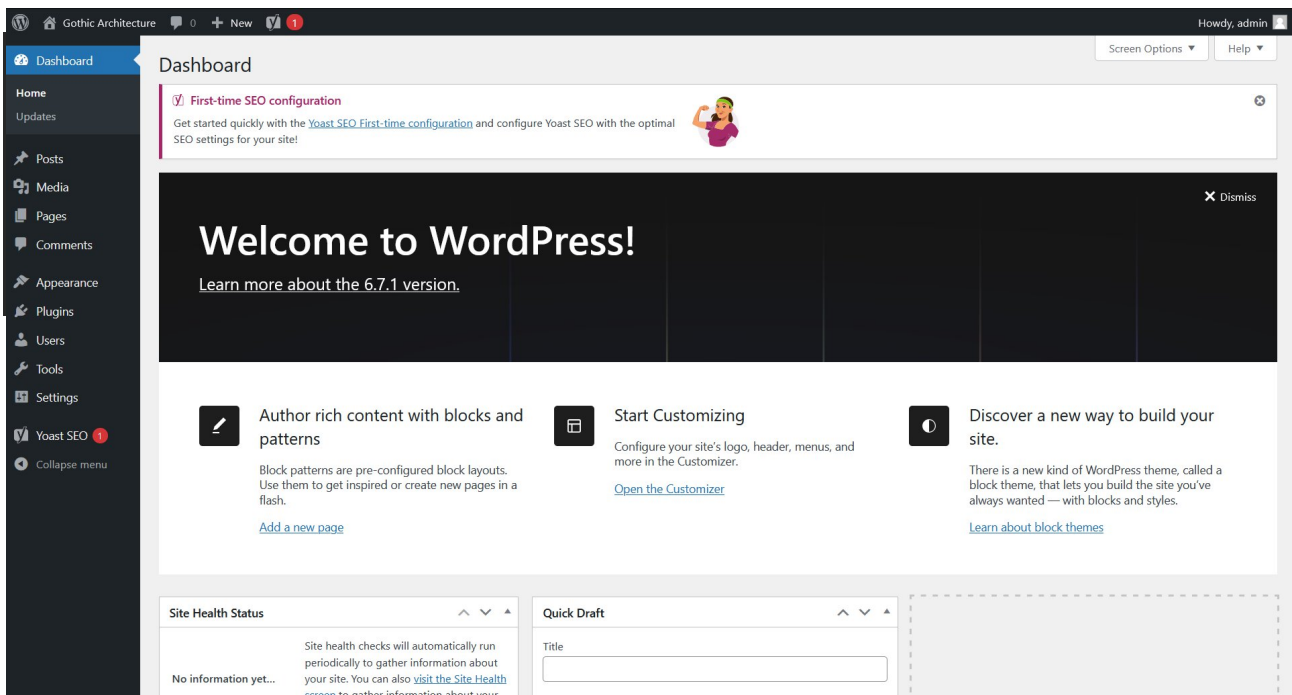

Открыл phpmyadmin в браузере и вошел под пользователем root. Создал нового пользователя(site-admin) и БД с таким же названием и паролем.

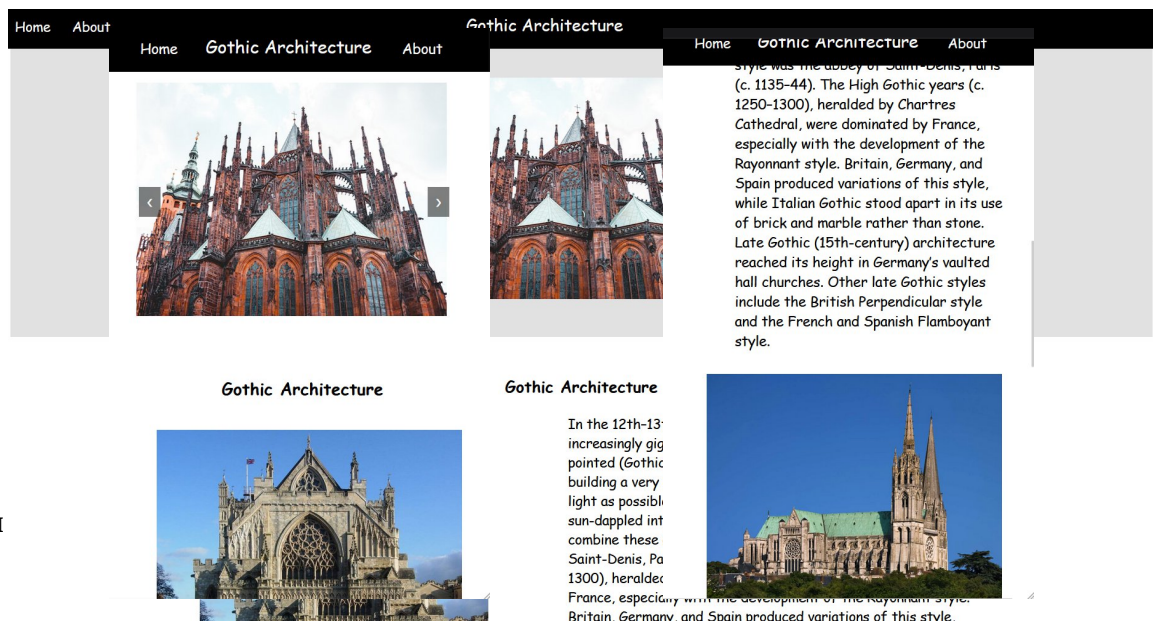

Далее идет установка wordpress. В папке /home/site распаковал архив wordpress и создал такую же папку .ost как и в phpmyadmin, но уже не указывал папку public в файле конфигурации.

Изменил файл конфигурации wp-config.php и запустил сайт в браузере. Следуя простым инструкциям, установил wordpress.

Создал тему и осуществил посадку верстки, используя материалы лабораторной работы 7.

A screenshot of a code editor window. The title bar shows 'project.ini' and '.htaccess'. The menu bar has 'Файл', 'Изменить', and 'Просмотр'. The code content is as follows:

```
AddType application/javascript .js
# BEGIN WordPress
# The directives (lines) between "BEGIN WordPress" and "END WordPress" are
# dynamically generated, and should only be modified via WordPress filters.
# Any changes to the directives between these markers will be overwritten.
# END WordPress
ErrorDocument 404 /index.php?error=404
```

A 'Удалить' (Delete) button is visible over the WordPress comment lines. The status bar at the bottom shows 'Строка 1, столбец 1 | 335 символов', '100%', 'Unix (LF)', and 'UTF-8'.

Установил и настроил плагин Yoast SEO, используя подбор слов.

Создал несколько пользователей и назначил им роли.

И последнее, создал рубрику для добавления записей и добавил одну.

Конец.
